

Food is Chemistry.  
Chemistry is Information.  
Information is Actionable.

What's in your food?

Use data to give you insights that have never been available before

## A FIRST IN FOOD PROCESSING

PPO Smart Imaging measures absorbed and reflected light to analyze the chemical makeup of a specific food product. This allows us to identify chemical differences which then identifies foreign objects and food quality, resulting in increased efficiencies and less waste. During this process, we collect data about your food product. We analyze the data and provide you with valuable insights.

Our solution is a management tool. We do more than just detect foreign objects and sort food. With our "train the brain" approach to data analytics and artificial intelligence, you will be able to:

- ✓ Negotiate better contracts with your suppliers
- ✓ Declare product quality using analytics
- ✓ Provide the nutritional value of each food product
- ✓ Differentiate yourself and set a new level of standards

Contact us to learn how our analytics will impact your business.
